

MASTER ASSET REGISTRY (MAR)

Purpose

The Master Asset Registry (MAR) is the official index of every approved asset within Explorer Studio.

Unlike the Master Asset Library, which defines governance, engineering, and standards, the Master Asset Registry records the actual assets that exist.

Every approved production asset receives exactly one permanent registry entry.

The registry is the authoritative source for determining:

- whether an asset exists,
- where it is stored,
- how it is classified,
- what productions use it,
- its approval status,
- its technical state,
- its reuse potential.

Registry Architecture

Every registered asset occupies one record.

The registry contains metadata only.

Detailed engineering remains in the Master Asset Specification.

Registry Structure

Every record contains the following fields.

Asset ID
Production Name
Display Name
Category
Family
Production Role
Hero Status
Current Version
Approval Status
Reuse Rating
Primary Production
Productions Using
Parent Asset
Primary Variant
Owner
Storage Location
Last Updated
Specification Reference

Registry Organization

The registry is organized by permanent asset category.

Chief Production Architect Review

This is the **first operational document** built from the Master Asset Library standards.

The relationship between documents is now clear:

- **Master Asset Library (MAL)** defines the rules.
- **Master Asset Registry (MAR)** lists every approved asset.
- **Master Asset Specification (MAS)** provides the detailed engineering record for each individual asset.

That means Explorer Studio has moved from defining standards to managing real production resources.

My recommendation before generating any assets

Do **not** start creating individual asset specifications one by one.
